DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 6/19/06 has been entered.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 21, 2, 3, 7, 8, 9, 10, 11, 12, 13, 19-20 rejected under 35 U.S.C. 102(b) as being anticipated by DE 2643769 (referred to as DE '769).

DE '769 discloses a lip seal having a sealing lip (7) and a shield (6), the sealing lip and the shield are coextensive, the shield and the sealing lip having ends (ends near 8), the ends of the sealing lip and the shield are closed together (ends are closed to form a nozzle configuration), a passage (passage that introduces fluid from annular chamber 14 to space 10) permitting to inject fluid under pressure to a space formed between the sealing lip and the shield lip, the sealing lip and the shield formed of first and second resilient members, the shield is flexible so as to be deformable by the pressure of the fluid (that is the case since the sealing lip and the shield are formed from resilient members), the first and second resilient members are annular (6 and 7 are annular), the lip seal having an outer diameter body portion from which the lip and the shield

Art Unit: 3673

extend radially inward (the body that is mounted in housing 3), the body portion is adapted for retention within a housing of a bore for a shaft (intended use, the body is capable of being mounted in a housing), the passage (the passage) is arranged to admit fluid between the shield and a groove portion (groove that forms 10) portion of the sealing lip, the passage comprises at least one radially extending portion (radially extending port from 14 that communicates with the space 10) through which the fluid is injected, the passage is arranged to admit fluid between the shield and a groove portion of the sealing lip and extends between the first and second annular members (passage extending in the body portion that has the first and second annular members), the shield has a shield lip (lip of 6 near 8), the sealing and shield lips being normally closed together, the passage permits injection of fluid between the closed lips at sufficient pressure to cause the lips to open during use to allow the fluid to flow towards the end of the sealing lip (the pressure fluid introduced in port 5, that is connected to an annular chamber 14, which finally communicates with the space to permit the lips to disengage and fluid to be released by the nozzle structure formed by the lips), the shield restricts material to pass the shield and into the space (this is the case when the shield is contacting the tube) and injecting fluid under pressure (fluid injected into space 10 via 14 and via 5) into a space between the lip and the shield to exit space by passing between the lip end and an end of the shield.

The sealing lip (7) having a first side (first side having a spring on that side) and a second side (opposite side of the first side), the lip seal having a shield (shield 6) coextensive with the sealing lip except for the lip end on the first side (this is the case since the lip end is under the shield 6) thereof to protect the sealing lip and to define a space with the lip. The shield and

Art Unit: 3673

sealing lip being normally closed together and in contact proximate the lip end (this is the case as seen in the figures, applicants argument that the document has a drawing error is not persuasive).

The shield is capable of being deformed by a pressure fluid. The shield and the sealing lip are resilient (both are formed of resilient material). The body portion is capable of being received in a housing.

The first and second members are annular. The lip seal having an outer body portion from which the lip and the shield extend radially inwardly (both the sealing lip and the shield extend radially from an outer body portion, see figures).

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over DE 2643769.

DE 2643769 discloses the claimed invention except for the lip seal to be made of reinforced elastomer. It would have been obvious to one having ordinary skill in the art at the time the invention was made to have the lip seal to be made of reinforced elastomer, since it has been held to be within the general skill of a worker in the art to select a know material on the basis of its suitability for the intended use as a matter of obvious design choice. In re Leshin, 125 USPQ 416. Furthermore to use an elastomer that is reinforced is well know to one skilled in the art to provide a sealing lip that is more durable or stronger.

Response to Arguments

6. Applicant's arguments filed 1/3/06 have been fully considered but they are not persuasive.

Applicants' argument the environment in patent DE 2643769 does not contain abrasive material is not persuasive because sea-water is know to have abrasive material (salt water and other material such as dust, waste or sand). Furthermore applicant argument to environment is not persuasive because applicant only claims a lip seal.

Applicants' argument that the reference DE 2643769 does not teach a shield is not persuasive because as stated in the rejection the member 6 acts as a shield for member 7.

Applicants' argument that the sealing lip and the shield of DE 2643769 do not contact is not persuasive because as stated in the rejection above the sealing lip and the shield contact.

Applicants' argument that the reference of DE 2643769 does not teach all the limitations of the claim is not persuasive in view of the rejection above.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Vishal Patel whose telephone number is 571-272-7060. The examiner can normally be reached on 6:30am to 8:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patricia L. Engle can be reached on 571-272-6660. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
